

Always-on sampling removes stalls, but increases deaths

Development evidence, fixed checkpoints: 203/630 (32.2%) greedy versus 202/630 (32.1%) sampled completions.
Equal attempts per level; no claim of universal controller superiority. Level5-3 is missing; 2-2/7-2 are excluded for absent human data.
These totals intentionally differ from the historical 22-model-level report, which included 2-2.
