

Two distinct clues: action timing and imagined-value inconsistency

Left: selected greedy-source groups; 10 conditional seeds/root, not independent level attempts. 1 decision = 4 emulator frames.

Right: equally weighted roots × four diagnostic prefixes; 18 pipe roots from 9 episodes, 7 reference roots from 3 episodes. No population CIs.

Observed-state values come from the same network, not ground truth. Fixed prefixes need not be paths explored by MCTS.

These results do not isolate dynamics, BatchNorm, or a universal action-hold fix. Full evidence and other groups: docs/VALUE_COMMITMENT_RESULTS_V1.md.
